

Remote Control Kit (JMP/RR/D/6745)

Our 2x25 and 2x50 gallon rigs can now be adapted for remote operation, primarily for use in test cells.

This kit is a supplied addition to an existing rig and consists of an actuated ball valve installed between the outlet of the delivery hose and the twin hose assembly which in turn connects to the engine wash probes. The valve is housed in its own box and comes supplied with an electrical 'plug and go' remote device. Connection of the valve to the delivery hose is via quick release couplings with the remote control switch attached using the supplied cable and Harting connector. This switch can now be positioned outside the test cell.
